

The SafetyCube project

SafetyCube project

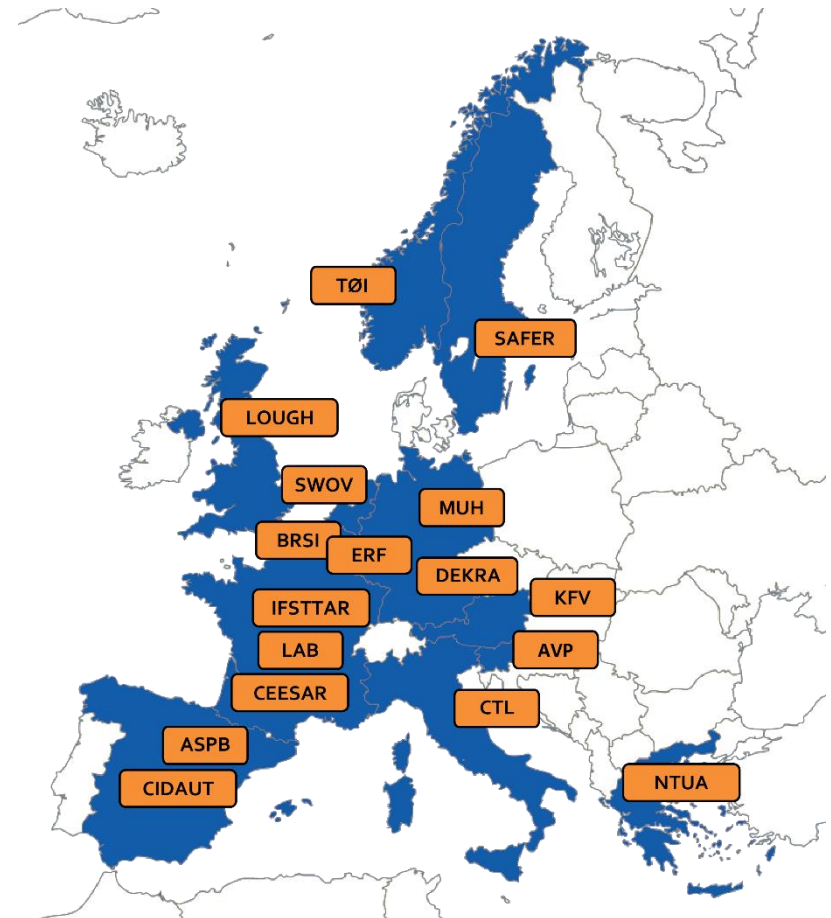

Funded by the European Commission under the Horizon 2020 research framework programme

Coordinator: Pete Thomas, Loughborough University

Start: May 2015

Finish: April 2018

17 partners from 12 EU countries

SafetyCube concept and vision

- — ○
- Problem
 - *Evidence based road safety policies are becoming more usual and there is much better availability of national data and state of the art knowledge*
 - *Effective road safety policies need good information about accident risk factors and about measures*
- SafetyCube will meet this need by generating new knowledge about accident risk factors and the effectiveness of measures relevant to Europe, to be integrated in a **European Road Safety Decision Support System (DSS)**

Challenges of the evidence based approach

- Do we have a comprehensive method to identify risks?
 - *Road, road users and vehicles*
- Do we have a comparable method to evaluate measures?
 - *Road, road users and vehicles*
- How do we estimate the likely casualty reduction of a measure that has not been introduced to the real-world?
- Do we have a comprehensive method to evaluate cost-effectiveness?
- How do we handle the situation where there are many measures of effectiveness but they disagree?

Accessing the evidence base

- Much of the evidence on risks and measures is in the research literature – how can it be brought together?
- How can we assess transferability of measures from one country to another?
- How can the available information and data be synthesised?
- How can it be made accessible to stakeholders?

SafetyCube will meet these challenges

○ — ○
SafetyCube will:

- Provide new information about the **effects of risk factors and related measures** by bringing together published information
- Produce a comprehensive method to evaluate the **costs and benefits** of measures
- Produce new information about **seriously injured** casualties
- Produce a new **Decision Support System** that will enable easy access to information on risks and measures

SafetyCube methodology

1. Creating **taxonomies** of risk factors and measures
 2. Exhaustive literature review and rigorous study selection criteria
 3. Use of a template for **coding studies**, to be introduced in the DSS back-end database
 4. Carrying out meta-analyses to estimate the effects of risk factors / measures.
 5. Drafting Synopses **summarising results** of risk factors / measures.
- **Systems approach:** links between infrastructure, user and vehicle risks
 - **Hot topics** & additional risk factors and measures
 - Assessment of the **quality of the data / study methods**

What have we already achieved?

- —————
- Mid-point of SafetyCube
- Consulted many different stakeholders
- Already reviewed and summarised hundreds of studies on crash risks
- Developed an outline of the SafetyCube DSS and its functionality
- Progressed well with work on serious injuries
- Preparing for the second half of the project
- Preparing for final project conference **22-23 March 2018 Vienna**

Development of the DSS

SafetyCube DSS Objectives

*The SafetyCube DSS objective is to provide the European and Global road safety community **a user friendly, web-based, interactive Decision Support Tool** to properly substantiate their road safety decisions for the actions, measures, programmes, policies and strategies to be implemented at local, regional, national, European and international level.*

The main contents of the SafetyCube DSS concern:

- road accident risk factors and problems
- road safety measures
- best estimate of casualty reduction effectiveness
- cost-benefit evaluation
- all related analytic background

Special focus is given to linking road safety problems with related countermeasures.

Current Road Safety DSS Worldwide

- Crash Modification Factors Clearinghouse (www.cmfclearinghouse.org)
by NHTSA (USA) - **5.151 CMF** on infrastructure only - on going
- Road Safety Engineering Kit (www.engtoolkit.com.au)
by Austroads (Australia) - **67 treatments** on infrastructure only
- PRACT Repository (www.pract-repository.eu)
by CEDR (Europe) - **889 CMF and 273 APM** on infrastructure only – high quality
- iRAP toolkit (toolkit.irap.org/)
by iRAP - **58 treatments** (43 on infrastructure)
- Safety Performance Factors Clearinghouse (spfclearinghouse.org)
by Tatum Group LLC, Dr. Andrew Kwasniak (USA) - **few SPF** – subscribers only

SafetyCube DSS Users

- **Public Authorities**
local, regional, national, European and international
- **Industry**
Infrastructure, Vehicle, Insurance, Technology
- **Research Institutes**
- **Non Governmental Organisations**
- **Mass media**

The SafetyCube DSS is intended to have **a life well beyond the end of the SafetyCube** research project. Furthermore, it will be developed in a form that can readily be incorporated within the existing European Road Safety Observatory of the European Commission DG-MOVE.

SafetyCube DSS Design Principles

- A **Modern** web-based tool
- High **Ergonomy** interface
- **Simple** structure
- Powerfull **Search** Engines
- Fully **Documented** information
- Easily **Updated**

SafetyCube DSS Search Engine

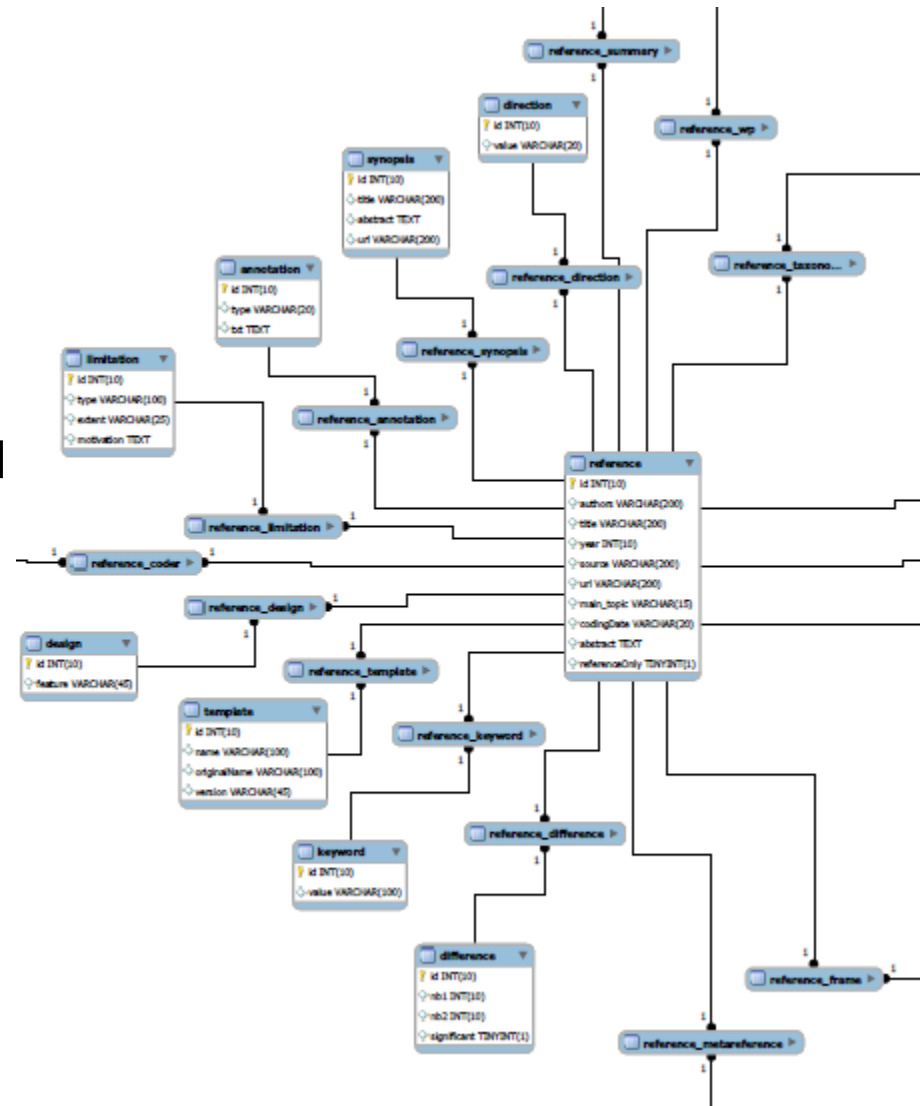

- **Fully linked** search
 - *search a road safety problem alone or through the measures*
 - *search a measure alone or through the road safety problems*
 - *search for risks and measures related to specific road user groups or crash types (accident scenaria)*
- **Fully detailed** search
 - *search by any parameter in each data table (road safety problems, measures)*
- **Fully flexible** search
 - *adjust and customize search according to results*
- **Fully documented** search
 - *access background information at any stage (links, etc.)*

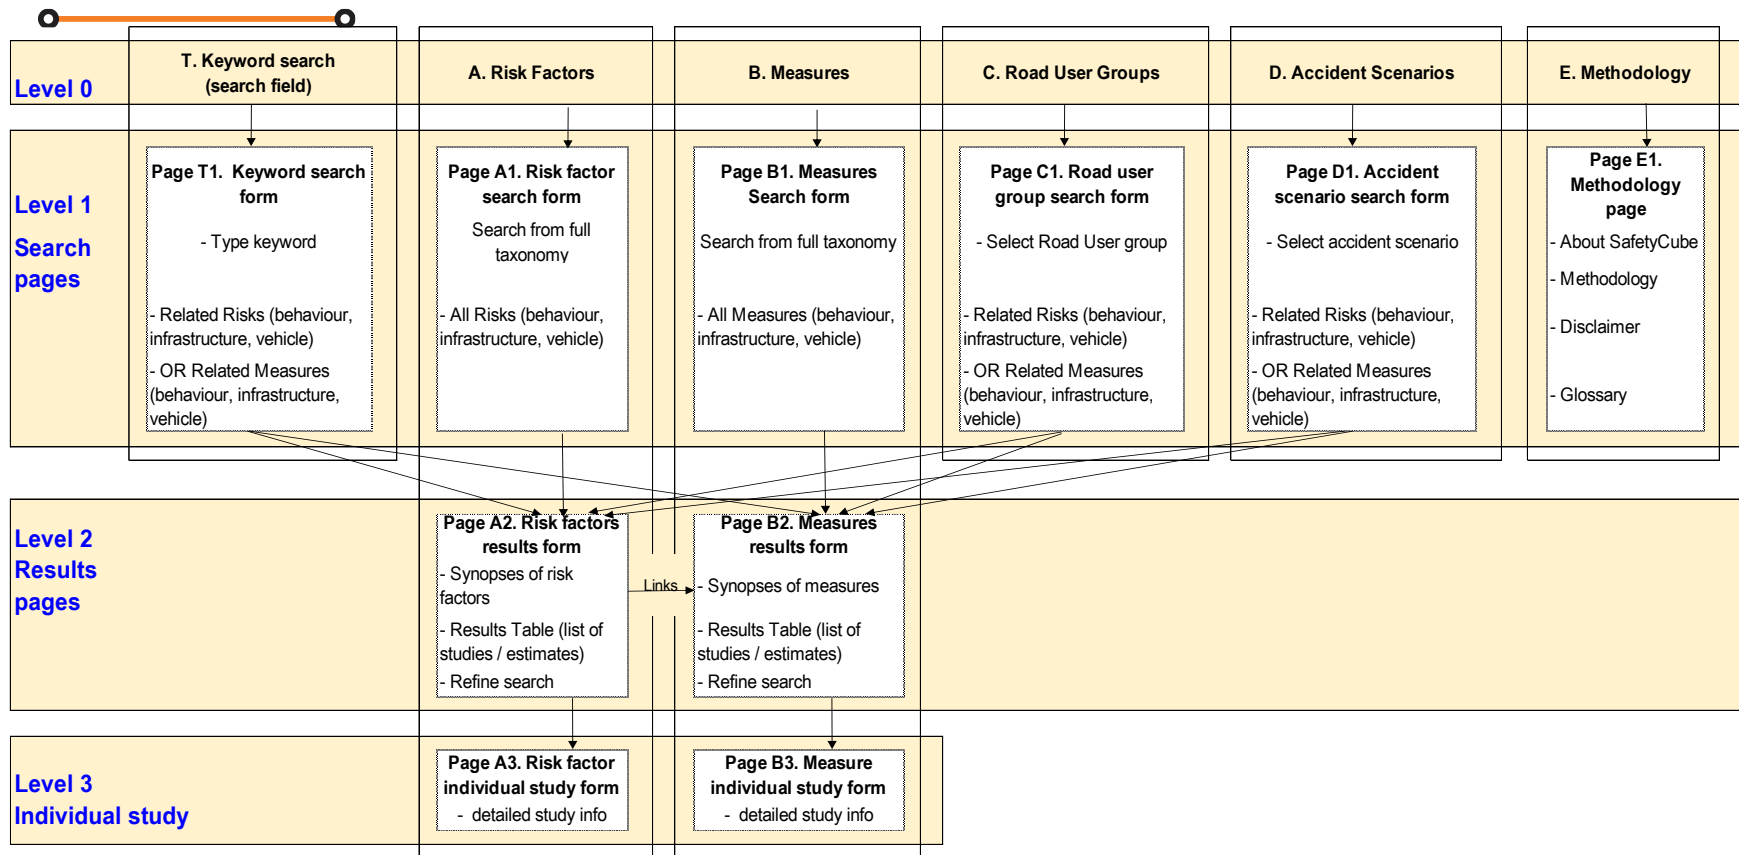

Relational Data Base

- The templates of **coded studies** undergo a thorough checking and debugging process
- The templates are eventually stored in a **relational database**, which serves as the back-end of the DSS
- Front-end DSS results are retrieved through **queries** on the back-end database (DSS search engine).

SafetyCube (Safety CaUsation, Benefits and Efficiency) is a research project funded by the European Commission under the Horizons 2020, the EU Framework Programme for Research and Innovation, in the domain of Road Safety. The project started on May 1st, 2015 and will run for a period of three years.

The primary objective of the SafetyCube project is to develop an innovative road safety **Decision Support System (DSS)** that will enable policy-makers and stakeholders to select and implement the most appropriate strategies, measures and cost-effective approaches to reduce casualties of all road user types and all severities in Europe and worldwide.

Funding Reference:
SafetyCube is a project financed by the European Commission: Innovation and Networks Executive Agency (INEA).

Search Methodology

Keyword Search	Risk Factors	Road Safety Measures	Road User Groups	Accident Scenarios
----------------	---------------------	----------------------	------------------	--------------------

Risk Factors		
Behaviour	Infrastructure	Vehicle
Speed choice	Traffic flow	Prevalence of vehicle factors in crash data
Influenced driving - alcohol	Road functional class	Injury mechanism
Influenced driving - drugs	Road surface deficiencies (risk of run-off road)	Crashworthiness
Risk taking	Poor visibility and lighting	Technical defects / Maintenance
Fatigue	Adverse weather	Protective equipment design
Distraction and inattention	Workzones	Visibility / conspicuity
Functional Impairment	Horizontal/vertical alignment deficiencies	
Insufficient skills	Superelevation / cross-slopes (risk of run-off road)	
Insufficient knowledge	Lanes / ramps deficiencies	
Emotions & Stress	Median / barrier deficiencies (risk of crash with oncoming traffic)	
Misjudgement & Observation Errors	Shoulder and roadside deficiencies (risk of run-off road or crash with obstacle)	
Traffic Rule Violations	Poor road readability	
Personal Factors	Interchange deficiencies	
Age	At-grade junctions deficiencies	
Diseases and disorders	Rail-road crossings (risk of collision with train)	
	Poor junction readability

Search Methodology

Risk Factors Search Results

The following information on Work Zones Risk Factor fulfill your search criteria. Refine your search, view the SafetyCube Synopses on Risk Factor, choose a study to obtain more detailed information, or go to the respective Road Safety Measures.

Work Zone duration PDF

The presence of long duration of workzones was initially considered a risk factor as more accidents are more likely to occur. This was reported by almost all coded studies which show a consistent increase in the number of accidents and confirmed by the preliminary (uncorrected for publication bias) meta-analysis carried out. However, publication bias was detected and the corrected meta-analysis showed a non-significant effect.

Work Zone length PDF

The presence of long workzones was initially considered a risk factor as more accidents are likely to occur in extensive work zone areas. This result was found by all coded studies which show a consistent negative effect on the number of accidents and confirmed by the meta-analysis carried out. One study also indicates that increased lengths of work zones are associated with high probability of accident occurrence.

Effects of work zone presence on injury and non-injury crashes

Khattak et al., 2002, Accident Analysis and Prevention, 34 pp 19-29

Abstract

Work zones in the United States have approximately 700 traffic-related fatalities, 24 000 injury crashes, and 52 000 non-injury crashes every year. Due to future highway reconstruction needs, work zones are likely to increase in number, duration, and length. This study focuses on analyzing the effect of work zone duration mainly due to its policy-sensitivity. To do so, we created a unique dataset of California freeway work zones that included crash data (crash frequency and injury severity), road inventory data (average daily traffic (ADT) and urban/rural character), and work zone related data (duration, length, and location). Then, we investigated crash rates and crash frequencies in the pre-work zone and during-work zone periods. For the freeway work zones investigated in this study, the total crash rate in the during-work zone period was 21.5% higher (0.79 crashes per million vehicle kilometer (MVKM)) than the pre-work zone period (0.65 crashes per MVKM). Compared with the pre-work zone period, the increase in non-injury and injury crash rates in the during-work zone period was 23.8% and 17.3%, respectively. Next, crash frequencies were investigated using negative binomial models, which showed that frequencies increased with increasing work zone duration, length, and average daily traffic. The important finding is that after controlling for various factors, longer work zone duration significantly increases both injury and non-injury crash frequencies.

url: <http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.525.2933&rep=rep1&type=pr>

Study design

Country: USA
Research methods: Negative Binomial Models
Design: Observational study, Cross-sectional
Sample: 2038 total accidents in 36 work zone sites in Indiana state, US, for the years 1992 ar
Risk group: Work zone
Control group:
Modifying conditions: AADT

The following effects on Work Zones are reported in this study:

Risk factor	Unit	Outcome variable	Effect type	Effect size	Main outcome
Ln of workzone duration	Days	Injury and non-injury crashes	Slope	1.1149	Significant negative effect on road safety
Ln of workzone duration	Days	Non-injury crashes	Slope	1.2317	Significant negative effect on road safety
Ln of workzone duration	Days	Injury crashes	Slope	1.2549	Significant negative effect on road safety
Ln of workzone length	Km	Injury and non-injury crashes	Slope	0.6718	Significant negative effect on road safety
Ln of workzone length	Km	Non-injury crashes	Slope	0.6112	Significant negative effect on road safety
Ln of workzone length	Km	Injury crashes	Slope	0.7842	Significant negative effect on road safety

Next steps

SafetyCube DSS Development

Next steps

- Development of the **static DSS** (Wire Frames)
 - *Completed*
 - *[further improved incorporating comments from this Workshop]*
- **SafetyCube DSS Development phase**
 - *between September and December 2016*
 - *including all risk factors (~3.500 effects from 600 studies) and several measures*
- **SafetyCube DSS Pilot Operation**
 - *starting early 2017*
- **SafetyCube DSS Opening**
 - *Starting mid 2017*
- **Continuous Enhancement and Update**
 - *Starting on April 2018 (end of SafetyCube project)*

Example questions addressed

- how important is my road safety problem?
- who else is having similar problems?
- what solutions are usually proposed for my problem?
- how efficient are the solutions proposed?
- which is the most efficient solution?
- and if I have a combination of problems ...

... then use SafetyCube DSS to have the answers

SafetyCube DSS

Delivering a long waited powerful tool

- The SafetyCube DSS is a Road Safety Decision Support Tool :
 - long waited,
 - powerful,
 - full of scientific evidence,
 - user friendly, web-based and interactive
- SafetyCube DSS is the first integrated road safety support system **developed in Europe**
- SafetyCube DSS **offers for the first time** scientific evidence on:
 - risks and not only measures
 - risks and measures not only on infrastructure
 - a very large number of estimates of risks and measures effects
 - links between risks factors and measures
- SafetyCube DSS aims to be **a reference system** for road safety in Europe, constantly improved and enhanced
