

Examining the influence of traffic enforcement

on the development of traffic safety culture

Abstract

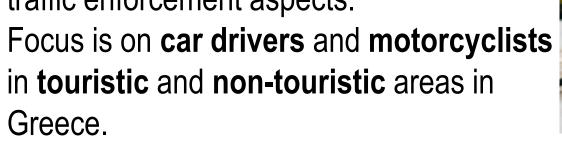

This paper aims to investigate the impact of traffic safety culture elements on the probability of road crash involvement, focusing on traffic enforcement aspects. Focus is on car drivers and motorcyclists in touristic and non-touristic areas in Greece. A questionnaire survey was conducted among car drivers and motorcycle riders in Athens and the on island of Rhodes on national and local traffic safety culture, paternalism, experience of road safety enforcement, road risk attribution and previous involvement in road crashes. Binary logistic regression was applied in an effort to find differentiations and common road safety culture elements between car drivers and motorcycle riders, but also drivers in Athens and Rhodes, in relation to road crash risk. Results indicate that drivers probably understand the importance of more intensive traffic enforcement as a means of traffic crash reduction; the development of a common traffic safety culture in the island of Rhodes in contrast to Athens and the importance of factors such as driving frequency, age and experience on crash probability.

Keywords: road safety, crash involvement, safety culture, enforcement

Introduction

The importance of traffic safety culture studies as a means of improving road safety level has been highlighted in the international literature. Moreover, it has been found that the enforcement level declared by drivers themselves is adversely proportional to traffic violations. Drivers' opinions on traffic enforcement, as well as the opinions about their or other drivers' risky behaviors, could be an important predictor of traffic violation probability. The relationship of the level of enforcement and road crash number varies significantly from region to region in Greece.

The main objective of the paper is to investigate the impact of traffic safety culture elements on the probability of road crash involvement, focusing on traffic enforcement aspects.

Data

Data used in this paper were collected through:

- a questionnaire survey in Greece
- conducted among private car drivers and motorcycle riders
- sampled in **Athens** (N=321) and the island of **Rhodes** (N=182) Analyzed questions and the respective, alternative answers were:

| CATEGORY | QUESTION | ALTERNATIVE ANSWERS |
|--|---|---|
| | Gender | male, female |
| General | Age | <26, 26-35, 36-45, 46-55, 56+ y.o. |
| | Period of valid driver license | 0-5, 6-10, 11-15, 16-20, 20+ years |
| | Highest education | primary school, high school, lyceum, professional school / technological university, university |
| | Area | Athens, Rhodes |
| | Type of vehicle | car, motorcycle |
| Expected driving behaviour (country/ municipality level) | When driving in my country /municipality, I expect from other drivers to respect and follow traffic rules | none/very few, less than half, about half, more than half, nearly all/all) |
| Expected driving behaviour (peers) | How many of your friends who regularly drive a car do you think they respect and follow traffic rules? | none/very few, less than half, about half, more than half, nearly all/all |
| Acceptance of traffic enforcement | The fact that crashes still happen in traffic, shows that the authorities should control road users' behaviour to a greater extent than they do today | totally disagree, disagree somewhat, neither agree or disagree, agree somewhat, totally agree |
| | The authorities should make it more difficult for people to engage in risky behaviour in traffic | |
| Traffic enforcement experience | In the course of the two last years, approximately how often have you seen a police inspection along the road? | never, hardly ever, 5 times or fewer, 10 times or fewer, 20 times or fewer, more than 20 times |
| Road risk attribution | In your opinion, is lacking police enforcement of traffic rules an important cause of traffic crashes in Greece? | unimportant, of little importance, neither important /nor unimportant, somewhat important, very important |
| Involvement in road | During the last 2 years, have you been | no, yes |

- Over 2/3 of the sample comprises men, 26-45 years old.
- The majority (69%) have had their driving license for >10 years.

involved in a traffic crash while driving?

Almost 90% of the drivers, drive every day.

crashes

- 33 to 42% of the drivers expect other drivers to follow traffic rules.
- More than 55% of the drivers have seen less than 5 police checks over the period of the last 2 years.
- Most drivers deem the lack of enforcement as an important cause of traffic crashes.

Statistical analysis

Analysis resulted in five binary logistic regression models in which the dependent variable was the **involvement in a traffic crash**.

Statistical checks require an independent value significance level of less than 0.05, a Hosmer-Lemeshow value significance greater than 5% and an R² value as close to 1 as possible.

Results

Model 1: Drivers of private cars and motorcycles in Athens and Rhodes

- Those who expect less than half of their friends to follow traffic rules are 39,3% less probable to being involved in a crash. This, maybe, shows that they consider others' behavior dangerous for themselves too and, as such, they make safer decisions.
- Those who declare that the **lack of enforcement** is not an important cause of traffic crashes are 2,5 times more probable to being involved in a traffic crash. This could be attributed to the fact that these drivers do not prefer stricter enforcement, because they obtain risky behaviors.
- Frequent drivers are more probable to crash involvement, due to their greater exposure to everyday risk.
- Drivers over 55 years old are also at greater risk compared to younger drivers.

Model 2: Drivers of private cars and motorcycles in Athens

- In Athens, drivers' behavior in the municipality plays a statistically significant role when it comes to traffic crash involvement. In particular, those who expect less than half of the drivers in their municipality to follow traffic rules, are 64% less probable to being involved in a crash.
- Women are less probable to being involved in a crash by 42,9% compared to men.

 Contrary to the drivers in Athens, those who expect less than half of the drivers in their municipality to follow traffic rules are 6,5 times more likely to being involved in a crash. This is likely attributed to the fact that in a small and secluded society, like the island of Rhodes, local social circle has a strong influence on behavior, causing drivers to follow social trends (in this case not following traffic rules) in order to avoid standing out or being considered irregular.

Results

Model 4: Drivers of private cars in Athens and Rhodes

• Declared police **enforcement frequency** is statistically important among car drivers, as those who have reported infrequent checks are 49,2% less probable to being involved in a crash. A likely explanation is that lack of enforcement forces drivers to adopt safer behaviors, as they feel exposed in a lowlevel enforced driving environment.

Model 5: Drivers of motorcycles in Athens and Rhodes

• Experience – and not age group – is a statistically significant variable among motorcycle riders. That been said, it is observed that riders with less than 5 years of experience are the least likely to being involved in a traffic crash. A possible contributing factor could be that motorcycle riding requires more skill than car driving and, thus, less experienced riders tend to be more careful on the road.

| Rhodes | ,507 | ,450 | 1,270 | 1 | ,260 | 1,660 | ,688 | 4,007 |

Conclusion

- Driving frequency and lack of enforcement being considered an important cause of crashes are two common statistically significant variables across all models. The latter shows that **drivers who** perceive that there is a lack of enforcement adopt less dangerous behaviors due to insecurity. They also understand that traffic enforcement is a key factor towards making roads safer, demanding its intensification.
- Older drivers and more experienced motorcycle riders are more prone to being involved in a crash, compared to all the other groups. This might show that age or experience comes at the cost of obtaining riskier driving habits.
- Friends' behavior is statistically significant when it comes to **smaller social groups**, like in Rhodes and among motorcyclists.
- The perceived behaviour of other drivers at municipality level, has a positive impact on drivers in Athens, yet a negative one on drivers in Rhodes. Thus, a common safety culture among drivers in a secluded touristic area is likely developed.
- Driver-declared enforcement frequency is only significant when it comes to car drivers, indicating that they are worried about low enforcement level and, because of that, they take fewer risks.
