# INTELLIGENT TRANSPORT SYSTEMS TODAY: A EUROPEAN PERSPECTIVE

Dr. Ioanna Spyropoulou, Dr. Matthew Karlaftis,  
Prof. John Golias, Dr. George Yannis, Merja Penttinen

---

## *Outline*

---

- ❖ General issues
- ❖ European studies on ITS impact
- ❖ Delphi study principles
- ❖ Questionnaire design
- ❖ Participant characteristics
- ❖ Questionnaire results
- ❖ Summary and Next steps

## *General (1/2)*

---

### ❖ **Activity Framework**

HUMANIST NoE → [www.noehumanist.org](http://www.noehumanist.org)

Task Force B "Evaluation of Potential ITS Benefits"

### ❖ **Objective**

Identify certain issues related to impact of ITS mainly on Road Safety

### ❖ **Tool**

Conduction of a Delphi Study - not to find the truth but the opinion of the people responsible for research, design, application and use of the systems

## *General (2/2)*

---

### ❖ **Intelligent Transport Systems - Definition**

Application of advanced sensor, computer electronics, and communication technologies and management strategies - in an integrated manner - in order to increase the safety and efficiency parameters of the transportation system

### ❖ **Why ITS?**

Anticipate positive impact on:

- Road Safety
- Network Conditions
- Environmental Conditions
- User comfort
- User integration

## *Studies on ITS impact (1/3)*

---

### ❖ ITS development

IDEA → PROTOTYPE → **ASSESSMENT** → MARKET  
INTRODUCTION

→ Assessment methods

→ Assessment measures

→ Results...

→ Are intelligent transport systems a promising means to  
the future?

## *Studies on ITS impact (2/3)*

---

### ❖ **Impact of Intelligent Speed Adaptation**

(Várhelyi et. al., 2002)

- Using a wide range of assessment methods
- Included elements (interaction) of non-users
- Effort to link system impact with accident data

### ❖ **Behavioural effects of Lane Departure Warning Systems**

(Alkim and Korse, 2003)

- Real network study
- No behavioural change (no of warnings over time)
- Impact on road safety could not be identified - system compensation

## *Studies on ITS impact (3/3)*

---

- ❖ **Prediction of driver drowsiness for fatigue warning systems (Muzet et. al., 2004)**
  - Use of driver simulator
  - Steering grip sensor signals - obj. and subj. sleepiness score
  - Significant correlations **BUT** differences from participant characteristics → **incorporation of individual characteristics into simulation programs is still an issue**
  
- ❖ **Impact of Adaptive Cruise Control and Intelligent Speed Adaptation systems (Yannis et. al., 2002)**
  - Use of traffic simulation programs (3 different ones)
  - Results of impact on road safety related to: simulation program, simulation scenario and variables used as assessment measures

## *Design of the Delphi Study (1/2)*

---

### ❖ **General elements of a Delphi study**

- Expert opinions recorded through structured and specific way
- Main objective to reach consensus amongst participants
- Conducted in the form of questionnaires
  - Step1** Participants receive questionnaires
  - Step2** Answers are analysed and comments are taken into account
  - Step3** Participants receive updated questionnaires along with their previous answers and the average answers
  - Step4** Steps 2 and 3 are repeated until reaching consensus or stability of respondents answers

### ❖ **General principles of design**

- Questionnaire
  - Should not be long
  - Should be clear, structured and comprehensive
- Expert characteristics
  - Attention on the type of experts
  - High drop-out rate between rounds

## Questionnaire design (1/2)

---

### ❖ Objectives → design

- Specific → Choice of IT systems investigated
  - Anticipation of impact on road safety
  - Systems for which there is no sufficient evidence but close to the market **BUT ALSO** "baseline" systems which are already widely used
  - Different systems in terms of their operation
  - ISA, ABS, Intersection Warning, Enhanced Navigation, Lateral Control

## Questionnaire design (2/2)

---

- Road Safety Impact → Questions mainly involve road safety & few general ones

First Part	General questions on the systems
Second Part	Questions on impact elements
Third Part	General conclusive questions and comments
Fourth Part	Questions on participant characteristics

- Clarification on issues → Questions for which there is a variety of answers
- Input on issues → Questions for which not sufficient research has been conducted
- Convenience in receiving and filling-in the questionnaire →  
Questionnaire at: <http://www.noehumanist.org/DelphiStudy>

## Participants characteristics (1/3)

- Number of participants → 33 (56)
- Variability → Country of work
  - Profession
  - Scientific Background

## Participants characteristics (2/3)

- Expertise and experience

Experience/Systems	ISA	ABS	Intersection Warning	Enhanced Navigation	Lateral Warning
Specialist/Expert	2	3	4	5	4
Knowledge Resulting from minor research	8	8	6	15	8
Knowledge Resulting from reading technical literature	24	19	18	18	21
No knowledge	1	5	5	0	3
Personal experience (system user)	6	21	2	14	2
Laboratory experience (use it only in tests)	9	5	9	11	10
No experience	19	9	21	9	20

## *Participants characteristics (2/3)*

---

- Expertise
  - Majority of respondents' expertise from technical literature
  - Enhanced navigation significant number resulting from minor research (probably on navigation functions)
  - Few respondents have no knowledge on systems
- Experience
  - Majority of respondents users of ABS
  - Around 30% of respondents lab experience on all systems except ABS
  - Significant amount of respondents no experience on ISA and Lateral Warning

# Questionnaire Results - System importance (1/4)

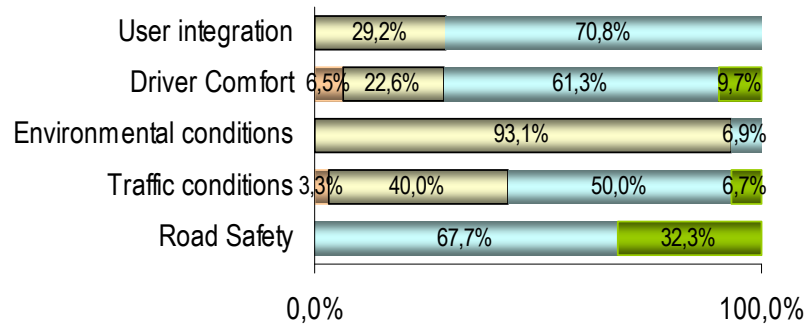

## ❖ Impact parameters

- Road safety
- Traffic conditions
- Environmental conditions
- Driver Comfort
- User Integration

# Questionnaire Results - System importance (2/4)

### Intersection Warning

■ highly negative ■ negative ■ no impact ■ positive ■ highly positive

### Enhanced Navigation

■ highly negative ■ negative ■ no impact ■ positive ■ highly positive

### Lateral Warning

■ highly negative ■ negative ■ no impact ■ positive ■ highly positive

## Questionnaire Results - System importance (3/4)

---

### ❖ Results

- All five systems are expected to contribute positively to road safety (intersection warning only positive impact)
- ABS and ISA most promising
- Systems score differently in different categories
- Negative impact anticipated on driver comfort by ISA

### ❖ Systems rating

- Road safety
- Acceptability Issues

## Questionnaire Results - System importance (4/4)

---

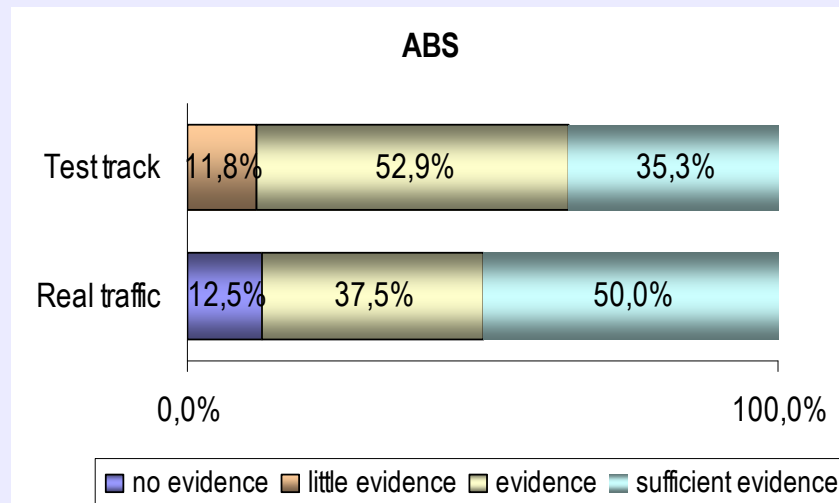

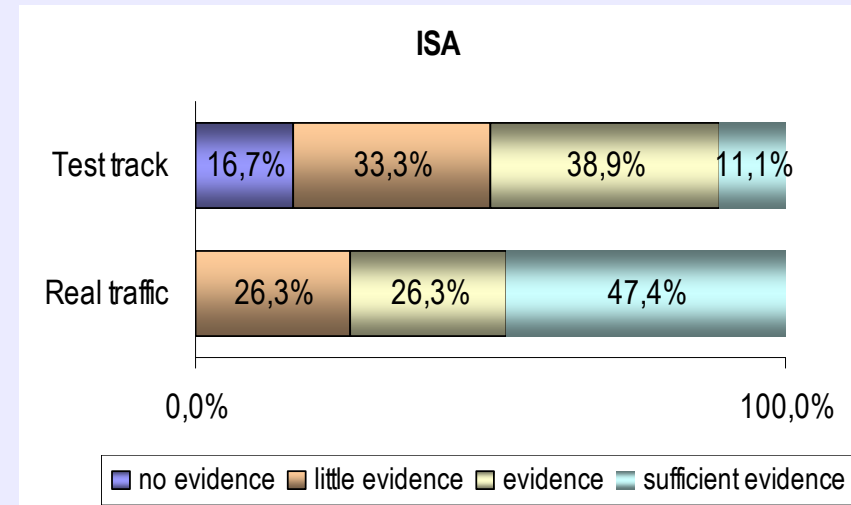

### ❖ Systems application

Development/Systems	ISA	ABS	Intersection Warning	Enhanced Navigation	Lateral Warning
In their current level of development	6	32	1	12	3
Following a few more impact studies	11	1	7	10	10
With some further development	9	1	24	9	18

- 20% (7) of experts that ISA should not be part of standard vehicle equipment, 3% (1) for intersection warning, 6% (2) enhanced navigation
- 2 respondents believe that more research is needed on ABS

## Questionnaire Results - Gaps in knowledge (1/3)

Amount of evidence available  
from the most appropriate  
types of studies

## Questionnaire Results - Gaps in knowledge (2/3)

### ❖ Available Evidence

ABS → sufficient amount

ISA → good amount

Intersection warning → Further research needed

Enhanced navigation → Further research needed

Lateral Warning → Further research needed

## *Questionnaire Results - Gaps in knowledge (3/3)*

---

### ❖ "No opinion" answers

- Relationship between penetration rates and impact
- System side effects
- + Appropriate types of studies for each system (except ABS)

## *Summary and Next steps*

---

- ✓ Preliminary results of Delphi study
- ✓ Diversity between answers
- ✓ Some general trends appear
- ✓ Gaps in knowledge are evident from the 1<sup>st</sup> Round

### ❖ Further analysis

- Link answers with expertise and participant characteristics
- Link system importance with willingness to pay
- Link answers with results from studies on the impact of ITS
- Conduct Round 2 of the Delphi Study
